Natural ingredients processes

SFE: Supercritical Fluid Extraction

Supercritical CO₂ Extraction is a technology in which carbon dioxide, put beyond its critical point (73 bars and 30°C), becomes a supercritical fluid with special properties.

The extraction carried out at a low temperature preserves the natural profile identity of the raw material.

It is among the most advanced and sustainable extraction technologies and is also safe for the workers and the environment.

Naturome

Volatile recovery from distillation or steam distillation of fruits, semi-dried materials.

Processing parameters are set up to complete original profile with volatiles. Referring to the European Flavor Regulation EC 1334/2008, Naturomes can be used in natural flavorings.

Essential Oil

Obtained by distillation of the biomass with water or steam.

The essential oil is physically separated from the aqueous phase by decantation.

Alcoholate

The biomass blended in a hydro-alcoholic solution is distilled.

Tincture / Infusion

Traditional maceration, warm (infusion) or cold (tincture) of a natural material in a hydro-alcoholic solution.

The alcohol remains in the product.

Concrete, Resinoid, Oleoresin

Obtained by primary volatile solvent extraction on biomass.

Absolute

Obtained through alcoholic purification of a primary solvent extraction (concrete or resinoid).

Extract

Primary non volatile solvent extraction on biomass.

Tetrarome®

Extraction of the rich aldehyde fractions of citrus oils obtained first by Cold Expression (primary extraction).

Citronova®

Distillation process in a special equipment design, keeping original Citrus oil profile generally lost in standard folding process.
